

We recently added a lot of branches. This page shall be used to describe 'em. Please create a separate page if the description is longer than a few sentences, following the naming rule "Branch" + camelCase(branch-folder with dashes stripped).

- [BranchJuScheduler](#) (german)

## **ju-roles-prototype**

Some SQL- and PHP-Stuff showing some of my ideas regarding roles- permissions- and user-management.

## **ju-spannende-experimente**

I'm experimenting with code automatic generation using XML+XSL. Currently generation of Java- and PHP-classes is possible, also an SQL-Script can be created. Meta-Programming deluxe!

## **ju-weniger-spannende-experimente**

This is a first draft of what became [BranchJuScheduler](#)

## **anjuha-simple-scheduler**

This is an attempt to transport the genetic scheduler from c++ to Java without "translating" directly: no copy&paste from the existing c++ code. The success of this attempt is currently unclear, as some main features necessary for testing are not implemented yet.
